The articles [21], [27], [3], [4], [18], [14], [28], [9], [10], [20], [22], [8], [13], [23], [2], [5], [1], [6], [12], [11], [17], [7], [16], [24], [19], [25], [15], and [26] provide the notation and terminology for this paper.

## 1. PRELIMINARIES

We adopt the following rules:  $k, m$  are natural numbers,  $x, X$  are sets, and  $N$  is a set with non empty elements.

Let  $f$  be a function and let  $g$  be a non empty function. One can verify that  $f+\cdot g$  is non empty and  $g+\cdot f$  is non empty.

Let  $f, g$  be finite functions. One can check that  $f+\cdot g$  is finite.

One can prove the following propositions:

- (1) For all functions  $f, g$  holds  $\text{dom } f \approx \text{dom } g$  iff  $f \approx g$ .
- (2) For all finite functions  $f, g$  such that  $\text{dom } f$  misses  $\text{dom } g$  holds  $\text{card}(f+\cdot g) = \text{card } f + \text{card } g$ .

Let  $f$  be a function and let  $A$  be a set. One can check that  $f \setminus A$  is function-like and relation-like. Next we state two propositions:

- (3) For all functions  $f, g$  such that  $x \in \text{dom } f \setminus \text{dom } g$  holds  $(f \setminus g)(x) = f(x)$ .
- (4) For every non empty finite set  $F$  holds  $\text{card } F - 1 = \text{card } F - '1$ .

## 2. PRODUCT LIKE SETS

Let  $S$  be a functional set. The functor  $\prod_S$  yielding a function is defined by:

- (Def. 1)(i) For every set  $x$  holds  $x \in \text{dom } \prod_S$  iff for every function  $f$  such that  $f \in S$  holds  $x \in \text{dom } f$  and for every set  $i$  such that  $i \in \text{dom } \prod_S$  holds  $\prod_S(i) = \pi_i S$  if  $S$  is non empty,
- (ii)  $\prod_S = \emptyset$ , otherwise.

We now state two propositions:

- (5) For every non empty functional set  $S$  holds  $\text{dom } \prod_S = \bigcap \{ \text{dom } f : f \text{ ranges over elements of } S \}$ .

- (6) For every non empty functional set  $S$  and for every set  $i$  such that  $i \in \text{dom} \prod_S$  holds  $\prod_S(i) = \{f(i) : f \text{ ranges over elements of } S\}$ .

Let  $S$  be a set. We say that  $S$  is product-like if and only if:

- (Def. 2) There exists a function  $f$  such that  $S = \prod f$ .

Let  $f$  be a function. Observe that  $\prod f$  is product-like.

Let us note that every set which is product-like is also functional and has common domain.

Let us note that there exists a set which is product-like and non empty.

The following propositions are true:

- (7) For every functional set  $S$  with common domain holds  $\text{dom} \prod_S = \text{DOM}(S)$ .
- (8) For every functional set  $S$  and for every set  $i$  such that  $i \in \text{dom} \prod_S$  holds  $\prod_S(i) = \pi_i S$ .
- (9) For every functional set  $S$  with common domain holds  $S \subseteq \prod \prod_S$ .
- (10) For every non empty product-like set  $S$  holds  $S = \prod \prod_S$ .

Let  $D$  be a set. One can verify that every set of finite sequences of  $D$  is functional.

Let  $i$  be a natural number and let  $D$  be a set. Observe that  $D^i$  has common domain.

Let  $i$  be a natural number and let  $D$  be a set. Note that  $D^i$  is product-like.

### 3. PROPERTIES OF AMI-STRUCT

We now state two propositions:

- (11) Let  $N$  be a set,  $S$  be an AMI over  $N$ , and  $F$  be a finite partial state of  $S$ . Then  $F \setminus X$  is a finite partial state of  $S$ .
- (12) Let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a programmed finite partial state of  $S$ . Then  $F \setminus X$  is a programmed finite partial state of  $S$ .

Let  $N$  be a set with non empty elements, let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$ , let  $i_1, i_2$  be instruction-locations of  $S$ , and let  $I_1, I_2$  be elements of the instructions of  $S$ . Then  $[i_1 \mapsto I_1, i_2 \mapsto I_2]$  is a finite partial state of  $S$ .

Let  $N$  be a set with non empty elements and let  $S$  be a halting non void AMI over  $N$ . Note that there exists an instruction of  $S$  which is halting.

Next we state three propositions:

- (13) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F$  be a lower programmed finite partial state of  $S$ , and  $G$  be a programmed finite partial state of  $S$ . If  $\text{dom} F = \text{dom} G$ , then  $G$  is lower.
- (14) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F$  be a lower programmed finite partial state of  $S$ , and  $f$  be an instruction-location of  $S$ . If  $f \in \text{dom} F$ , then  $\text{locnum}(f) < \text{card} F$ .
- (15) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a lower programmed finite partial state of  $S$ . Then  $\text{dom} F = \{i_{l_S}(k); k \text{ ranges over natural numbers: } k < \text{card} F\}$ .

Let  $N$  be a set, let  $S$  be an AMI over  $N$ , and let  $I$  be an element of the instructions of  $S$ . The functor  $\text{AddressPart}(I)$  is defined as follows:

- (Def. 3)  $\text{AddressPart}(I) = I_2$ .

Let  $N$  be a set, let  $S$  be an AMI over  $N$ , and let  $I$  be an element of the instructions of  $S$ . Then  $\text{AddressPart}(I)$  is a finite sequence of elements of  $\bigcup N \cup$  the carrier of  $S$ .

One can prove the following proposition

- (16) Let  $N$  be a set,  $S$  be an AMI over  $N$ , and  $I, J$  be elements of the instructions of  $S$ . If  $\text{InsCode}(I) = \text{InsCode}(J)$  and  $\text{AddressPart}(I) = \text{AddressPart}(J)$ , then  $I = J$ .

Let  $N$  be a set and let  $S$  be an AMI over  $N$ . We say that  $S$  is homogeneous if and only if:

- (Def. 4) For all instructions  $I, J$  of  $S$  such that  $\text{InsCode}(I) = \text{InsCode}(J)$  holds  $\text{dom AddressPart}(I) = \text{dom AddressPart}(J)$ .

The following proposition is true

- (17) For every instruction  $I$  of  $\text{STC}(N)$  holds  $\text{AddressPart}(I) = 0$ .

Let  $N$  be a set, let  $S$  be an AMI over  $N$ , and let  $T$  be an instruction type of  $S$ . The functor  $\text{AddressParts } T$  is defined as follows:

- (Def. 5)  $\text{AddressParts } T = \{\text{AddressPart}(I); I \text{ ranges over instructions of } S: \text{InsCode}(I) = T\}$ .

Let  $N$  be a set, let  $S$  be an AMI over  $N$ , and let  $T$  be an instruction type of  $S$ . Note that  $\text{AddressParts } T$  is functional.

Let  $N$  be a set with non empty elements, let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $I$  be an instruction of  $S$ . We say that  $I$  has explicit jumps if and only if the condition (Def. 6) is satisfied.

- (Def. 6) Let  $f$  be a set. Suppose  $f \in \text{JUMP}(I)$ . Then there exists a set  $k$  such that  $k \in \text{dom AddressPart}(I)$  and  $f = (\text{AddressPart}(I))(k)$  and  $\prod_{\text{AddressParts InsCode}(I)}(k) =$  the instruction locations of  $S$ .

We say that  $I$  has no implicit jumps if and only if the condition (Def. 7) is satisfied.

- (Def. 7) Let  $f$  be a set. Given a set  $k$  such that  $k \in \text{dom AddressPart}(I)$  and  $f = (\text{AddressPart}(I))(k)$  and  $\prod_{\text{AddressParts InsCode}(I)}(k) =$  the instruction locations of  $S$ . Then  $f \in \text{JUMP}(I)$ .

Let  $N$  be a set with non empty elements and let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$ . We say that  $S$  has explicit jumps if and only if:

- (Def. 8) Every instruction of  $S$  has explicit jumps.

We say that  $S$  has no implicit jumps if and only if:

- (Def. 9) Every instruction of  $S$  has no implicit jumps.

Let  $N$  be a set and let  $S$  be an AMI over  $N$ . We say that  $S$  has non trivial instruction locations if and only if:

- (Def. 10) The instruction locations of  $S$  are non trivial.

Let  $N$  be a set with non empty elements. Note that every IC-Ins-separated definite non empty non void AMI over  $N$  which is standard has also non trivial instruction locations.

Let  $N$  be a set with non empty elements. Observe that there exists an IC-Ins-separated definite non empty non void AMI over  $N$  which is standard.

Let  $N$  be a set with non empty elements and let  $S$  be an AMI over  $N$  with non trivial instruction locations. Observe that the instruction locations of  $S$  is non trivial.

Next we state the proposition

- (18) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I$  be an instruction of  $S$ . If for every instruction-location  $f$  of  $S$  holds  $\text{NIC}(I, f) = \{\text{NextLoc } f\}$ , then  $\text{JUMP}(I)$  is empty.

Let  $N$  be a set with non empty elements and let  $I$  be an instruction of  $\text{STC}(N)$ . Observe that  $\text{JUMP}(I)$  is empty.

Let  $N$  be a set and let  $S$  be an AMI over  $N$ . We say that  $S$  is regular if and only if:

- (Def. 11) For every instruction type  $T$  of  $S$  holds  $\text{AddressParts } T$  is product-like.

Let  $N$  be a set. Observe that every AMI over  $N$  which is regular is also homogeneous.  
We now state the proposition

- (19) For every instruction type  $T$  of  $\text{STC}(N)$  holds  $\text{AddressParts } T = \{0\}$ .

Let  $N$  be a set with non empty elements. One can verify that  $\text{STC}(N)$  is regular and has explicit jumps and no implicit jumps.

Let  $N$  be a set with non empty elements. One can check that there exists an IC-Ins-separated definite non empty non void AMI over  $N$  which is standard, regular, halting, realistic, steady-programmed, and programmable and has explicit jumps and no implicit jumps.

Let  $N$  be a set with non empty elements, let  $S$  be a regular AMI over  $N$ , and let  $T$  be an instruction type of  $S$ . One can check that  $\text{AddressParts } T$  is product-like.

Let  $N$  be a set with non empty elements, let  $S$  be a homogeneous AMI over  $N$ , and let  $T$  be an instruction type of  $S$ . Note that  $\text{AddressParts } T$  has common domain.

Next we state the proposition

- (20) Let  $S$  be a homogeneous non empty non void AMI over  $N$ ,  $I$  be an instruction of  $S$ , and  $x$  be a set. Suppose  $x \in \text{dom AddressPart}(I)$ . Suppose  $\prod_{\text{AddressParts InsCode}(I)}(x) =$  the instruction locations of  $S$ . Then  $(\text{AddressPart}(I))(x)$  is an instruction-location of  $S$ .

Let  $N$  be a set with non empty elements and let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$  with explicit jumps. Note that every instruction of  $S$  has explicit jumps.

Let  $N$  be a set with non empty elements and let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps. Observe that every instruction of  $S$  has no implicit jumps.

We now state the proposition

- (21) Let  $S$  be a realistic IC-Ins-separated definite non empty non void AMI over  $N$  with non trivial instruction locations and  $I$  be an instruction of  $S$ . If  $I$  is halting, then  $\text{JUMP}(I)$  is empty.

Let  $N$  be a set with non empty elements, let  $S$  be a halting realistic IC-Ins-separated definite non empty non void AMI over  $N$  with non trivial instruction locations, and let  $I$  be a halting instruction of  $S$ . Note that  $\text{JUMP}(I)$  is empty.

Let  $N$  be a set with non empty elements and let  $S$  be an IC-Ins-separated definite non empty non void AMI over  $N$  with non trivial instruction locations. One can verify that there exists a finite partial state of  $S$  which is non trivial and programmed.

Let  $N$  be a set with non empty elements and let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$ . Observe that every non empty programmed finite partial state of  $S$  which is trivial is also unique-halt.

Let  $N$  be a set, let  $S$  be an AMI over  $N$ , and let  $I$  be an instruction of  $S$ . We say that  $I$  is instruction location free if and only if:

- (Def. 12) For every set  $x$  such that  $x \in \text{dom AddressPart}(I)$  holds  $\prod_{\text{AddressParts InsCode}(I)}(x) \neq$  the instruction locations of  $S$ .

The following two propositions are true:

- (22) Let  $S$  be a halting realistic IC-Ins-separated definite non empty non void AMI over  $N$  with explicit jumps and non trivial instruction locations and  $I$  be an instruction of  $S$ . If  $I$  is instruction location free, then  $\text{JUMP}(I)$  is empty.
- (23) Let  $S$  be a realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and non trivial instruction locations and  $I$  be an instruction of  $S$ . If  $I$  is halting, then  $I$  is instruction location free.

Let  $N$  be a set with non empty elements and let  $S$  be a realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and non trivial instruction locations. One can check that every instruction of  $S$  which is halting is also instruction location free.

We now state the proposition

- (24) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $I$  be an instruction of  $S$ . If  $I$  is sequential, then  $I$  is instruction location free.

Let  $N$  be a set with non empty elements and let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps. Observe that every instruction of  $S$  which is sequential is also instruction location free.

Let  $N$  be a set with non empty elements and let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$ . The functor  $\text{Stop}S$  yielding a finite partial state of  $S$  is defined as follows:

(Def. 13)  $\text{Stop}S = \text{il}_S(0) \dashrightarrow \mathbf{halt}_S$ .

Let  $N$  be a set with non empty elements and let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$ . Note that  $\text{Stop}S$  is lower, non empty, programmed, and trivial.

Let  $N$  be a set with non empty elements and let  $S$  be a standard realistic halting IC-Ins-separated definite non empty non void AMI over  $N$ . One can check that  $\text{Stop}S$  is closed.

Let  $N$  be a set with non empty elements and let  $S$  be a standard halting steady-programmed IC-Ins-separated definite non empty non void AMI over  $N$ . One can verify that  $\text{Stop}S$  is autonomic.

We now state three propositions:

- (25) For every standard halting IC-Ins-separated definite non empty non void AMI  $S$  over  $N$  holds  $\text{card}\text{Stop}S = 1$ .
- (26) Let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a pre-Macro of  $S$ . If  $\text{card}F = 1$ , then  $F = \text{Stop}S$ .
- (27) For every standard halting IC-Ins-separated definite non empty non void AMI  $S$  over  $N$  holds  $\text{LastLoc}\text{Stop}S = \text{il}_S(0)$ .

Let  $N$  be a set with non empty elements and let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$ . One can verify that  $\text{Stop}S$  is halt-ending and unique-halt.

Let  $N$  be a set with non empty elements and let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$ . Then  $\text{Stop}S$  is a pre-Macro of  $S$ .

#### 4. ON THE COMPOSITION OF MACRO INSTRUCTIONS

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $I$  be an element of the instructions of  $S$ , and let  $k$  be a natural number. The functor  $\text{IncAddr}(I, k)$  yielding an instruction of  $S$  is defined by the conditions (Def. 14).

- (Def. 14)(i)  $\text{InsCode}(\text{IncAddr}(I, k)) = \text{InsCode}(I)$ ,
- (ii)  $\text{domAddressPart}(\text{IncAddr}(I, k)) = \text{domAddressPart}(I)$ , and
- (iii) for every set  $n$  such that  $n \in \text{domAddressPart}(I)$  holds if  $\prod_{\text{AddressParts}} \text{InsCode}(I)(n) =$  the instruction locations of  $S$ , then there exists an instruction-location  $f$  of  $S$  such that  $f = (\text{AddressPart}(I))(n)$  and  $(\text{AddressPart}(\text{IncAddr}(I, k)))(n) = \text{il}_S(k + \text{locnum}(f))$  and if  $\prod_{\text{AddressParts}} \text{InsCode}(I)(n) \neq$  the instruction locations of  $S$ , then  $(\text{AddressPart}(\text{IncAddr}(I, k)))(n) = (\text{AddressPart}(I))(n)$ .

Next we state three propositions:

- (28) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I$  be an element of the instructions of  $S$ . Then  $\text{IncAddr}(I, 0) = I$ .
- (29) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I$  be an instruction of  $S$ . If  $I$  is instruction location free, then  $\text{IncAddr}(I, k) = I$ .
- (30) Let  $S$  be a halting standard realistic regular IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps. Then  $\text{IncAddr}(\mathbf{halt}_S, k) = \mathbf{halt}_S$ .

Let  $N$  be a set with non empty elements, let  $S$  be a halting standard realistic regular IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps, let  $I$  be a halting instruction of  $S$ , and let  $k$  be a natural number. Observe that  $\text{IncAddr}(I, k)$  is halting.

Next we state several propositions:

- (31) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I$  be an instruction of  $S$ . Then  $\text{AddressPartsInsCode}(I) = \text{AddressPartsInsCode}(\text{IncAddr}(I, k))$ .
- (32) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I, J$  be instructions of  $S$ . Given a natural number  $k$  such that  $\text{IncAddr}(I, k) = \text{IncAddr}(J, k)$ . Suppose  $\prod_{\text{AddressPartsInsCode}(I)}(x) =$  the instruction locations of  $S$ . Then  $\prod_{\text{AddressPartsInsCode}(J)}(x) =$  the instruction locations of  $S$ .
- (33) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I, J$  be instructions of  $S$ . Given a natural number  $k$  such that  $\text{IncAddr}(I, k) = \text{IncAddr}(J, k)$ . Suppose  $\prod_{\text{AddressPartsInsCode}(I)}(x) \neq$  the instruction locations of  $S$ . Then  $\prod_{\text{AddressPartsInsCode}(J)}(x) \neq$  the instruction locations of  $S$ .
- (34) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I, J$  be instructions of  $S$ . If there exists a natural number  $k$  such that  $\text{IncAddr}(I, k) = \text{IncAddr}(J, k)$ , then  $I = J$ .
- (35) Let  $S$  be a regular standard halting realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $I$  be an instruction of  $S$ . If  $\text{IncAddr}(I, k) = \mathbf{halt}_S$ , then  $I = \mathbf{halt}_S$ .
- (36) Let  $S$  be a regular standard halting realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $I$  be an instruction of  $S$ . If  $I$  is sequential, then  $\text{IncAddr}(I, k)$  is sequential.
- (37) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $I$  be an instruction of  $S$ . Then  $\text{IncAddr}(\text{IncAddr}(I, k), m) = \text{IncAddr}(I, k + m)$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $p$  be a programmed finite partial state of  $S$ , and let  $k$  be a natural number. The functor  $\text{IncAddr}(p, k)$  yielding a finite partial state of  $S$  is defined by:

(Def. 15)  $\text{dom IncAddr}(p, k) = \text{dom } p$  and for every natural number  $m$  such that  $\text{il}_S(m) \in \text{dom } p$  holds  $(\text{IncAddr}(p, k))(\text{il}_S(m)) = \text{IncAddr}(\pi_{\text{il}_S(m)} p, k)$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be a programmed finite partial state of  $S$ , and let  $k$  be a natural number. Note that  $\text{IncAddr}(F, k)$  is programmed.

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be an empty programmed finite partial state of  $S$ , and let  $k$  be a natural number. Note that  $\text{IncAddr}(F, k)$  is empty.

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be a non empty programmed finite partial state of  $S$ , and let  $k$  be a natural number. Observe that  $\text{IncAddr}(F, k)$  is non empty.

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be a lower programmed finite partial state of  $S$ , and let  $k$  be a natural number. Note that  $\text{IncAddr}(F, k)$  is lower.

One can prove the following two propositions:

- (38) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a programmed finite partial state of  $S$ . Then  $\text{IncAddr}(F, 0) = F$ .
- (39) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a lower programmed finite partial state of  $S$ . Then  $\text{IncAddr}(\text{IncAddr}(F, k), m) = \text{IncAddr}(F, k + m)$ .

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $p$  be a finite partial state of  $S$ , and let  $k$  be a natural number. The functor  $\text{Shift}(p, k)$  yielding a finite partial state of  $S$  is defined by the conditions (Def. 16).

- (Def. 16)(i)  $\text{dom Shift}(p, k) = \{\text{il}_S(m+k); m \text{ ranges over natural numbers: } \text{il}_S(m) \in \text{dom } p\}$ , and  
(ii) for every natural number  $m$  such that  $\text{il}_S(m) \in \text{dom } p$  holds  $(\text{Shift}(p, k))(\text{il}_S(m+k)) = p(\text{il}_S(m))$ .

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be a finite partial state of  $S$ , and let  $k$  be a natural number. One can check that  $\text{Shift}(F, k)$  is programmed.

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be an empty finite partial state of  $S$ , and let  $k$  be a natural number. One can verify that  $\text{Shift}(F, k)$  is empty.

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , let  $F$  be a non empty programmed finite partial state of  $S$ , and let  $k$  be a natural number. Note that  $\text{Shift}(F, k)$  is non empty.

We now state four propositions:

- (40) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a programmed finite partial state of  $S$ . Then  $\text{Shift}(F, 0) = F$ .  
(41) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F$  be a finite partial state of  $S$ , and  $k$  be a natural number. If  $k > 0$ , then  $\text{il}_S(0) \notin \text{dom Shift}(F, k)$ .  
(42) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a finite partial state of  $S$ . Then  $\text{Shift}(\text{Shift}(F, m), k) = \text{Shift}(F, m+k)$ .  
(43) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a programmed finite partial state of  $S$ . Then  $\text{dom } F \approx \text{dom Shift}(F, k)$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $I$  be an instruction of  $S$ . We say that  $I$  is IC-good if and only if:

- (Def. 17) For every natural number  $k$  and for all states  $s_1, s_2$  of  $S$  such that  $s_2 = s_1 + \cdot (\mathbf{IC}_S \xrightarrow{+} (\mathbf{IC}_{(s_1)} + k))$  holds  $\mathbf{IC}_{\text{Exec}(I, s_1)} + k = \mathbf{IC}_{\text{Exec}(\text{IncAddr}(I, k), s_2)}$ .

Let  $N$  be a set with non empty elements and let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ . We say that  $S$  is IC-good if and only if:

- (Def. 18) Every instruction of  $S$  is IC-good.

Let  $N$  be a set with non empty elements, let  $S$  be a non void AMI over  $N$ , and let  $I$  be an instruction of  $S$ . We say that  $I$  is Exec-preserving if and only if the condition (Def. 19) is satisfied.

- (Def. 19) Let  $s_1, s_2$  be states of  $S$ . Suppose  $s_1$  and  $s_2$  are equal outside the instruction locations of  $S$ . Then  $\text{Exec}(I, s_1)$  and  $\text{Exec}(I, s_2)$  are equal outside the instruction locations of  $S$ .

Let  $N$  be a set with non empty elements and let  $S$  be a non void AMI over  $N$ . We say that  $S$  is Exec-preserving if and only if:

- (Def. 20) Every instruction of  $S$  is Exec-preserving.

We now state the proposition

- (44) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $I$  be an instruction of  $S$ . If  $I$  is sequential, then  $I$  is IC-good.

Let  $N$  be a set with non empty elements and let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps. Observe that every instruction of  $S$  which is sequential is also IC-good.

Next we state the proposition

- (45) Let  $S$  be a regular standard realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $I$  be an instruction of  $S$ . If  $I$  is halting, then  $I$  is IC-good.

Let  $N$  be a set with non empty elements and let  $S$  be a regular standard realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps. One can verify that every instruction of  $S$  which is halting is also IC-good.

One can prove the following proposition

- (46) For every non void AMI  $S$  over  $N$  and for every instruction  $I$  of  $S$  such that  $I$  is halting holds  $I$  is Exec-preserving.

Let  $N$  be a set with non empty elements and let  $S$  be a non void AMI over  $N$ . Note that every instruction of  $S$  which is halting is also Exec-preserving.

Let  $N$  be a set with non empty elements. Note that  $\text{STC}(N)$  is IC-good and Exec-preserving.

Let  $N$  be a set with non empty elements. Observe that there exists a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  which is halting, realistic, steady-programmed, programmable, IC-good, and Exec-preserving and has explicit jumps and no implicit jumps.

Let  $N$  be a set with non empty elements and let  $S$  be an IC-good regular standard IC-Ins-separated definite non empty non void AMI over  $N$ . Observe that every instruction of  $S$  is IC-good.

Let  $N$  be a set with non empty elements and let  $S$  be an Exec-preserving non void AMI over  $N$ . One can check that every instruction of  $S$  is Exec-preserving.

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F$  be a non empty programmed finite partial state of  $S$ . The functor  $\text{CutLastLoc } F$  yields a finite partial state of  $S$  and is defined as follows:

(Def. 21)  $\text{CutLastLoc } F = F \setminus (\text{LastLoc } F \mapsto F(\text{LastLoc } F))$ .

One can prove the following two propositions:

- (47) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a non empty programmed finite partial state of  $S$ . Then  $\text{dom } \text{CutLastLoc } F = \text{dom } F \setminus \{\text{LastLoc } F\}$ .
- (48) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a non empty programmed finite partial state of  $S$ . Then  $\text{dom } F = \text{dom } \text{CutLastLoc } F \cup \{\text{LastLoc } F\}$ .

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F$  be a non empty trivial programmed finite partial state of  $S$ . One can check that  $\text{CutLastLoc } F$  is empty.

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F$  be a non empty programmed finite partial state of  $S$ . Note that  $\text{CutLastLoc } F$  is programmed.

Let  $N$  be a set with non empty elements, let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F$  be a lower non empty programmed finite partial state of  $S$ . One can verify that  $\text{CutLastLoc } F$  is lower.

One can prove the following three propositions:

- (49) Let  $S$  be a standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a non empty programmed finite partial state of  $S$ . Then  $\text{card } \text{CutLastLoc } F = \text{card } F - 1$ .
- (50) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F$  be a lower non empty programmed finite partial state of  $S$ , and  $G$  be a non empty programmed finite partial state of  $S$ . Then  $\text{dom } \text{CutLastLoc } F$  misses  $\text{dom } \text{Shift}(\text{IncAddr}(G, \text{card } F - 1), \text{card } F - 1)$ .
- (51) Let  $S$  be a standard halting IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F$  be a unique-halt lower non empty programmed finite partial state of  $S$ , and  $I$  be an instruction-location of  $S$ . If  $I \in \text{dom } \text{CutLastLoc } F$ , then  $(\text{CutLastLoc } F)(I) \neq \mathbf{halt}_S$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F, G$  be non empty programmed finite partial states of  $S$ . The functor  $F; G$  yielding a finite partial state of  $S$  is defined as follows:

(Def. 22)  $F; G = \text{CutLastLoc } F + \cdot \text{Shift}(\text{IncAddr}(G, \text{card } F - '1), \text{card } F - '1)$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F, G$  be non empty programmed finite partial states of  $S$ . One can check that  $F; G$  is non empty and programmed.

One can prove the following proposition

(52) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F$  be a lower non empty programmed finite partial state of  $S$ , and  $G$  be a non empty programmed finite partial state of  $S$ . Then  $\text{card}(F; G) = (\text{card } F + \text{card } G) - 1$  and  $\text{card}(F; G) = (\text{card } F + \text{card } G) - '1$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F, G$  be lower non empty programmed finite partial states of  $S$ . One can verify that  $F; G$  is lower.

One can prove the following four propositions:

(53) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F, G$  be lower non empty programmed finite partial states of  $S$ . Then  $\text{dom } F \subseteq \text{dom}(F; G)$ .

(54) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F, G$  be lower non empty programmed finite partial states of  $S$ . Then  $\text{CutLastLoc } F \subseteq \text{CutLastLoc } F; G$ .

(55) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$  and  $F, G$  be lower non empty programmed finite partial states of  $S$ . Then  $(F; G)(\text{LastLoc } F) = (\text{IncAddr}(G, \text{card } F - '1))(\text{il}_S(0))$ .

(56) Let  $S$  be a regular standard IC-Ins-separated definite non empty non void AMI over  $N$ ,  $F, G$  be lower non empty programmed finite partial states of  $S$ , and  $f$  be an instruction-location of  $S$ . If  $\text{locnum}(f) < \text{card } F - 1$ , then  $(\text{IncAddr}(F, \text{card } F - '1))(f) = (\text{IncAddr}(F; G, \text{card } F - '1))(f)$ .

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard realistic halting steady-programmed IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps, let  $F$  be a lower non empty programmed finite partial state of  $S$ , and let  $G$  be a halt-ending lower non empty programmed finite partial state of  $S$ . Note that  $F; G$  is halt-ending.

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard realistic halting steady-programmed IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps, and let  $F, G$  be halt-ending unique-halt lower non empty programmed finite partial states of  $S$ . Note that  $F; G$  is unique-halt.

Let  $N$  be a set with non empty elements, let  $S$  be a regular standard realistic halting steady-programmed IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps, and let  $F, G$  be pre-Macros of  $S$ . Then  $F; G$  is a pre-Macro of  $S$ .

Let  $N$  be a set with non empty elements, let  $S$  be a realistic halting steady-programmed IC-good Exec-preserving regular standard IC-Ins-separated definite non empty non void AMI over  $N$ , and let  $F, G$  be closed lower non empty programmed finite partial states of  $S$ . Note that  $F; G$  is closed.

We now state several propositions:

(57) Let  $S$  be a regular standard halting realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps. Then  $\text{IncAddr}(\text{Stop } S, k) = \text{Stop } S$ .

(58) For every standard halting IC-Ins-separated definite non empty non void AMI  $S$  over  $N$  holds  $\text{Shift}(\text{Stop } S, k) = \text{il}_S(k) \mapsto \mathbf{halt}_S$ .

- (59) Let  $S$  be a regular standard halting realistic IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $F$  be a pre-Macro of  $S$ . Then  $F$ ; Stop  $S = F$ .
- (60) Let  $S$  be a regular standard halting IC-Ins-separated definite non empty non void AMI over  $N$  and  $F$  be a pre-Macro of  $S$ . Then Stop  $S$ ;  $F = F$ .
- (61) Let  $S$  be a regular standard realistic halting steady-programmed IC-Ins-separated definite non empty non void AMI over  $N$  with no implicit jumps and  $F, G, H$  be pre-Macros of  $S$ . Then  $(F; G); H = F; (G; H)$ .
