Predicate Calculus for Boolean Valued Functions.
Part VII

Shunichi Kobayashi
Ueda Multimedia Information Center
Nagano

Summary. In this paper, we proved some elementary predicate calculus formulae containing the quantifiers of Boolean valued functions with respect to partitions. Such a theory is an analogy of usual predicate logic.

The articles [10], [9], [2], [12], [13], [1], [11], [14], [7], [8], [3], [5], [4], and [6] provide the notation and terminology for this paper.

The following proposition is true

(1)   Let Y be a non empty set, a be an element of $Boolean^Y$, G be a subset of PARTITIONS(Y), A, B, C be partitions of Y, and z, u be elements of Y. Suppose G is independent and $G = \{A, B, C\}$ and $A \neq B$ and $B \neq C$ and $C \neq A$ and EqClass(z, C) = EqClass(u, C). Then EqClass(u, CompF(A, G)) meets EqClass(z, CompF(B, G)).
