The articles [6], [16], [1], [14], [4], [11], [5], [10], [13], [2], [8], [7], [15], [9], [12], and [3] provide the notation and terminology for this paper.

In this paper k, n denote natural numbers and r denotes a real number.

Let us consider n. The functor \mathcal{R}^n yields a non empty set of finite sequences of \mathbb{R} and is defined as follows:

(Def. 1)
$$\mathcal{R}^n = \mathbb{R}^n$$
.

In the sequel x denotes a finite sequence of elements of \mathbb{R} .

The function $|\Box|_{\mathbb{R}}$ from \mathbb{R} into \mathbb{R} is defined by:

(Def. 2) For every
$$r$$
 holds $|\Box|_{\mathbb{R}}(r) = |r|$.

Let us consider x. The functor |x| yielding a finite sequence of elements of \mathbb{R} is defined as follows:

(Def. 3)
$$|x| = |\Box|_{\mathbb{R}} \cdot x$$
.

Let us consider n. The functor $\langle \underbrace{0,\dots,0}_n \rangle$ yields a finite sequence of elements of $\mathbb R$ and is defined

as follows:

(Def. 4)
$$\langle \underbrace{0, \dots, 0}_{n} \rangle = n \mapsto (0 \text{ qua real number}).$$

Let us consider n. Then $\langle \underbrace{0,\ldots,0}_{n} \rangle$ is an element of \mathbb{R}^{n} .

In the sequel x, x_1 , x_2 , y denote elements of \mathcal{R}^n .

Let us consider n, x. Then -x is an element of \mathcal{R}^n .

Let us consider n, x, y. Then x + y is an element of \mathbb{R}^n . Then x - y is an element of \mathbb{R}^n .

Let us consider n, let r be a real number, and let us consider x. Then $r \cdot x$ is an element of \mathbb{R}^n .

Let us consider n, x. Then |x| is an element of \mathbb{R}^n .

Let us consider n, x. Then 2x is an element of \mathbb{R}^n .

Let x be a finite sequence of elements of \mathbb{R} . The functor |x| yields a real number and is defined as follows:

(Def. 5)
$$|x| = \sqrt{\sum^2 x}$$
.

One can prove the following propositions:

- $(2)^1 \quad \text{len } x = n.$
- (3) dom x = Seg n.
- (4) $x(k) \in \mathbb{R}$.
- (5) If for every k such that $k \in \operatorname{Seg} n$ holds $x_1(k) = x_2(k)$, then $x_1 = x_2$.
- (6) If r = x(k), then |x|(k) = |r|.
- (7) $|\langle \underbrace{0,\ldots,0}_{n}\rangle| = n \mapsto (0 \text{ qua real number}).$
- (8) |-x| = |x|.
- $(9) \quad |r \cdot x| = |r| \cdot |x|.$
- $(10) \quad \left| \left\langle \underbrace{0, \dots, 0}_{n} \right\rangle \right| = 0.$
- (11) If |x| = 0, then $x = \langle \underbrace{0, \dots, 0}_{n} \rangle$.
- (12) $|x| \ge 0$.
- (13) |-x| = |x|.
- $(14) \quad |r \cdot x| = |r| \cdot |x|.$
- $(15) |x_1 + x_2| \le |x_1| + |x_2|.$
- $(16) |x_1 x_2| \le |x_1| + |x_2|.$
- $(17) \quad |x_1| |x_2| \le |x_1 + x_2|.$
- $(18) \quad |x_1| |x_2| \le |x_1 x_2|.$
- (19) $|x_1 x_2| = 0$ iff $x_1 = x_2$.
- (20) If $x_1 \neq x_2$, then $|x_1 x_2| > 0$.
- (21) $|x_1 x_2| = |x_2 x_1|$.
- $(22) |x_1 x_2| \le |x_1 x| + |x x_2|.$

Let us consider n. The functor ρ^n yielding a function from $[:\mathcal{R}^n, \mathcal{R}^n:]$ into \mathbb{R} is defined by:

(Def. 6) For all elements x, y of \mathcal{R}^n holds $\rho^n(x, y) = |x - y|$.

We now state two propositions:

- (23) $^{2}(x-y) = ^{2}(y-x)$.
- (24) ρ^n is a metric of \mathcal{R}^n .

Let us consider n. The functor \mathcal{E}^n yields a strict metric space and is defined as follows:

(Def. 7)
$$\mathcal{E}^n = \langle \mathcal{R}^n, \rho^n \rangle$$
.

Let us consider n. One can check that \mathcal{E}^n is non empty.

Let us consider n. The functor \mathcal{E}_{T}^{n} yields a strict topological space and is defined by:

¹ The proposition (1) has been removed.

(Def. 8) $\mathcal{E}_{T}^{n} = (\mathcal{E}^{n})_{top}$.

Let us consider n. Observe that \mathcal{E}_T^n is non empty.

We use the following convention: p, p_1 , p_2 , p_3 are points of \mathcal{E}_T^n and x, x_1 , x_2 , y, y_1 , y_2 are real numbers.

The following four propositions are true:

- (25) The carrier of $\mathcal{E}_{T}^{n} = \mathcal{R}^{n}$.
- (26) p is a function from Seg n into \mathbb{R} .
- (27) p is a finite sequence of elements of \mathbb{R} .
- (28) For every finite sequence f such that f = p holds len f = n.

Let us consider n. The functor $0_{\mathcal{E}^n_T}$ yielding a point of \mathcal{E}^n_T is defined by:

(Def. 9)
$$0_{\mathcal{E}_{T}^{n}} = \langle \underbrace{0, \dots, 0}_{n} \rangle.$$

Let us consider n, p_1 , p_2 . The functor $p_1 + p_2$ yielding a point of \mathcal{E}_T^n is defined by:

(Def. 10) For all elements p'_1 , p'_2 of \mathcal{R}^n such that $p'_1 = p_1$ and $p'_2 = p_2$ holds $p_1 + p_2 = p'_1 + p'_2$.

Let us observe that the functor $p_1 + p_2$ is commutative.

One can prove the following propositions:

- (29) For every element x of \mathcal{R}^n holds $^2|x| = ^2x$.
- (30) $(p_1+p_2)+p_3=p_1+(p_2+p_3).$
- (31) $0_{\mathcal{E}_{\mathbf{T}}^n} + p = p$ and $p + 0_{\mathcal{E}_{\mathbf{T}}^n} = p$.

Let us consider x, n, p. The functor $x \cdot p$ yielding a point of \mathcal{E}_T^n is defined as follows:

(Def. 11) For every element p' of \Re^n such that p' = p holds $x \cdot p = x \cdot p'$.

Next we state several propositions:

- $(32) \quad x \cdot 0_{\mathcal{E}_{\mathbf{T}}^n} = 0_{\mathcal{E}_{\mathbf{T}}^n}.$
- (33) $1 \cdot p = p \text{ and } 0 \cdot p = 0_{\mathcal{E}_T^n}$
- (34) $(x \cdot y) \cdot p = x \cdot (y \cdot p)$.
- (35) If $x \cdot p = 0_{\mathcal{E}_T^n}$, then x = 0 or $p = 0_{\mathcal{E}_T^n}$.
- (36) $x \cdot (p_1 + p_2) = x \cdot p_1 + x \cdot p_2$.
- $(37) \quad (x+y) \cdot p = x \cdot p + y \cdot p.$
- (38) If $x \cdot p_1 = x \cdot p_2$, then x = 0 or $p_1 = p_2$.

Let us consider n, p. The functor -p yielding a point of \mathcal{E}_T^n is defined by:

(Def. 12) For every element p' of \mathcal{R}^n such that p' = p holds -p = -p'.

One can prove the following propositions:

- (39) --p = p.
- $(40) \quad p + -p = 0_{\mathcal{E}^n_{\mathbf{T}}}.$
- (41) If $p_1 + p_2 = 0_{\mathcal{E}_T^n}$, then $p_1 = -p_2$ and $p_2 = -p_1$.
- $(42) \quad -(p_1+p_2)=-p_1+-p_2.$

(43)
$$-p = (-1) \cdot p$$
.

(44)
$$-x \cdot p = (-x) \cdot p \text{ and } -x \cdot p = x \cdot -p.$$

Let us consider n, p_1 , p_2 . The functor $p_1 - p_2$ yields a point of \mathcal{E}_T^n and is defined as follows:

(Def. 13) For all elements p'_1 , p'_2 of \mathcal{R}^n such that $p'_1 = p_1$ and $p'_2 = p_2$ holds $p_1 - p_2 = p'_1 - p'_2$. The following propositions are true:

$$(45) \quad p_1 - p_2 = p_1 + -p_2.$$

$$(46) \quad p-p=0_{\mathcal{E}_{\mathbf{T}}^n}.$$

(47) If
$$p_1 - p_2 = 0_{\mathcal{E}_T^n}$$
, then $p_1 = p_2$.

(48)
$$-(p_1-p_2) = p_2-p_1$$
 and $-(p_1-p_2) = -p_1+p_2$.

(49)
$$p_1 + (p_2 - p_3) = (p_1 + p_2) - p_3$$
.

(50)
$$p_1 - (p_2 + p_3) = p_1 - p_2 - p_3$$
.

(51)
$$p_1 - (p_2 - p_3) = (p_1 - p_2) + p_3.$$

(52)
$$p = (p+p_1) - p_1$$
 and $p = (p-p_1) + p_1$.

(53)
$$x \cdot (p_1 - p_2) = x \cdot p_1 - x \cdot p_2$$
.

(54)
$$(x-y) \cdot p = x \cdot p - y \cdot p$$
.

In the sequel p, p_1 , p_2 denote points of \mathcal{E}_T^2 .

The following proposition is true

(55) There exist real numbers x, y such that $p = \langle x, y \rangle$.

Let us consider p. The functor p_1 yielding a real number is defined as follows:

(Def. 14) For every finite sequence f such that p = f holds $p_1 = f(1)$.

The functor p_2 yielding a real number is defined by:

(Def. 15) For every finite sequence f such that p = f holds $p_2 = f(2)$.

Let x, y be real numbers. The functor [x,y] yielding a point of \mathcal{E}_T^2 is defined as follows:

(Def. 16)
$$[x, y] = \langle x, y \rangle$$
.

The following propositions are true:

(56)
$$[x, y]_1 = x$$
 and $[x, y]_2 = y$.

(57)
$$p = [p_1, p_2].$$

(58)
$$0_{\mathcal{E}_r^2} = [0,0].$$

(59)
$$p_1 + p_2 = [(p_1)_1 + (p_2)_1, (p_1)_2 + (p_2)_2].$$

(60)
$$[x_1, y_1] + [x_2, y_2] = [x_1 + x_2, y_1 + y_2].$$

(61)
$$x \cdot p = [x \cdot p_1, x \cdot p_2].$$

(62)
$$x \cdot [x_1, y_1] = [x \cdot x_1, x \cdot y_1].$$

(63)
$$-p = [-p_1, -p_2].$$

(64)
$$-[x_1, y_1] = [-x_1, -y_1].$$

(65)
$$p_1 - p_2 = [(p_1)_1 - (p_2)_1, (p_1)_2 - (p_2)_2].$$

(66)
$$[x_1, y_1] - [x_2, y_2] = [x_1 - x_2, y_1 - y_2].$$
