# The Product of the Families of the Groups 

Artur Korniłowicz<br>University of Białystok

## MML Identifier: GROUP_7.

WWW:http://mizar.org/JFM/Vol10/group_7.html

The articles [14], [13], [7], [19], [20], [4], [6], [2], [5], [8], [9], [3], [10], [16], [17], [18], [15], [1], [11], and [12] provide the notation and terminology for this paper.

## 1. PRELIMINARIES

In this paper $a, b, c, d, e, f$ are sets.
Next we state three propositions:
(1) If $\langle a\rangle=\langle b\rangle$, then $a=b$.
(2) If $\langle a, b\rangle=\langle c, d\rangle$, then $a=c$ and $b=d$.
(3) If $\langle a, b, c\rangle=\langle d, e, f\rangle$, then $a=d$ and $b=e$ and $c=f$.

## 2. The Product of the Families of the Groups

We follow the rules: $i, I$ are sets, $f, g, h$ are functions, and $s$ is a many sorted set indexed by $I$.
Let $R$ be a binary relation. We say that $R$ is groupoid yielding if and only if:
(Def. 1) For every set $y$ such that $y \in \operatorname{rng} R$ holds $y$ is a non empty groupoid.
Let us mention that every function which is groupoid yielding is also 1 -sorted yielding.
Let $I$ be a set. Note that there exists a many sorted set indexed by $I$ which is groupoid yielding.
Let us note that there exists a function which is groupoid yielding.
Let $I$ be a set. A family of semigroups indexed by $I$ is a groupoid yielding many sorted set indexed by $I$.

Let $I$ be a non empty set, let $F$ be a family of semigroups indexed by $I$, and let $i$ be an element of $I$. Then $F(i)$ is a non empty groupoid.

Let $I$ be a set and let $F$ be a family of semigroups indexed by $I$. Note that the support of $F$ is non-empty.

Let $I$ be a set and let $F$ be a family of semigroups indexed by $I$. The functor $\Pi F$ yields a strict groupoid and is defined by the conditions (Def. 2).
(Def. 2)(i) The carrier of $\Pi F=\Pi$ (the support of $F$ ), and
(ii) for all elements $f, g$ of $\Pi$ (the support of $F$ ) and for every set $i$ such that $i \in I$ there exists a non empty groupoid $F_{1}$ and there exists a function $h$ such that $F_{1}=F(i)$ and $h=$ (the multiplication of $\Pi F)(f, g)$ and $h(i)=\left(\right.$ the multiplication of $\left.F_{1}\right)(f(i), g(i))$.

Let $I$ be a set and let $F$ be a family of semigroups indexed by $I$. Observe that $\Pi F$ is non empty.
Let $I$ be a set and let $F$ be a family of semigroups indexed by $I$. Note that every element of $\Pi F$ is function-like and relation-like.

Let $I$ be a set, let $F$ be a family of semigroups indexed by $I$, and let $f, g$ be elements of $\Pi$ (the support of $F$ ). Note that (the multiplication of $\Pi F)(f, g)$ is function-like and relation-like.

We now state the proposition
(4) Let $F$ be a family of semigroups indexed by $I, G$ be a non empty groupoid, $p, q$ be elements of $\Pi F$, and $x, y$ be elements of $G$. Suppose $i \in I$ and $G=F(i)$ and $f=p$ and $g=q$ and $h=p \cdot q$ and $f(i)=x$ and $g(i)=y$. Then $x \cdot y=h(i)$.

Let $I$ be a set and let $F$ be a family of semigroups indexed by $I$. We say that $F$ is group-like if and only if:
(Def. 3) For every set $i$ such that $i \in I$ there exists a group-like non empty groupoid $F_{1}$ such that $F_{1}=F(i)$.

We say that $F$ is associative if and only if:
(Def. 4) For every set $i$ such that $i \in I$ there exists an associative non empty groupoid $F_{1}$ such that $F_{1}=F(i)$.

We say that $F$ is commutative if and only if:
(Def. 5) For every set $i$ such that $i \in I$ there exists a commutative non empty groupoid $F_{1}$ such that $F_{1}=F(i)$.

Let $I$ be a non empty set and let $F$ be a family of semigroups indexed by $I$. Let us observe that $F$ is group-like if and only if:
(Def. 6) For every element $i$ of $I$ holds $F(i)$ is group-like.
Let us observe that $F$ is associative if and only if:
(Def. 7) For every element $i$ of $I$ holds $F(i)$ is associative.
Let us observe that $F$ is commutative if and only if:
(Def. 8) For every element $i$ of $I$ holds $F(i)$ is commutative.
Let $I$ be a set. Note that there exists a family of semigroups indexed by $I$ which is group-like, associative, and commutative.

Let $I$ be a set and let $F$ be a group-like family of semigroups indexed by $I$. Note that $\Pi F$ is group-like.

Let $I$ be a set and let $F$ be an associative family of semigroups indexed by $I$. Observe that $\Pi F$ is associative.

Let $I$ be a set and let $F$ be a commutative family of semigroups indexed by $I$. Observe that $\Pi F$ is commutative.

One can prove the following propositions:
(5) Let $F$ be a family of semigroups indexed by $I$ and $G$ be a non empty groupoid. If $i \in I$ and $G=F(i)$ and $\Pi F$ is group-like, then $G$ is group-like.
(6) Let $F$ be a family of semigroups indexed by $I$ and $G$ be a non empty groupoid. If $i \in I$ and $G=F(i)$ and $\Pi F$ is associative, then $G$ is associative.
(7) Let $F$ be a family of semigroups indexed by $I$ and $G$ be a non empty groupoid. If $i \in I$ and $G=F(i)$ and $\Pi F$ is commutative, then $G$ is commutative.
(8) Let $F$ be a group-like family of semigroups indexed by $I$. Suppose that for every set $i$ such that $i \in I$ there exists a group-like non empty groupoid $G$ such that $G=F(i)$ and $s(i)=1_{G}$. Then $s=1_{\Pi F}$.
(9) Let $F$ be a group-like family of semigroups indexed by $I$ and $G$ be a group-like non empty groupoid. If $i \in I$ and $G=F(i)$ and $f=1_{\Pi F}$, then $f(i)=1_{G}$.
(10) Let $F$ be an associative group-like family of semigroups indexed by $I$ and $x$ be an element of $\Pi F$. Suppose that
(i) $x=g$, and
(ii) for every set $i$ such that $i \in I$ there exists a group $G$ and there exists an element $y$ of $G$ such that $G=F(i)$ and $s(i)=y^{-1}$ and $y=g(i)$.
Then $s=x^{-1}$.
(11) Let $F$ be an associative group-like family of semigroups indexed by $I, x$ be an element of $\Pi F, G$ be a group, and $y$ be an element of $G$. If $i \in I$ and $G=F(i)$ and $f=x$ and $g=x^{-1}$ and $f(i)=y$, then $g(i)=y^{-1}$.

Let $I$ be a set and let $F$ be an associative group-like family of semigroups indexed by $I$. The functor sum $F$ yielding a strict subgroup of $\Pi F$ is defined by the condition (Def. 9).
(Def. 9) Let $x$ be a set. Then $x \in$ the carrier of $\operatorname{sum} F$ if and only if there exists an element $g$ of $\Pi$ (the support of $F$ ) and there exists a finite subset $J$ of $I$ and there exists a many sorted set $f$ indexed by $J$ such that $g=1_{\Pi F}$ and $x=g+\cdot f$ and for every set $j$ such that $j \in J$ there exists a group-like non empty groupoid $G$ such that $G=F(j)$ and $f(j) \in$ the carrier of $G$ and $f(j) \neq 1_{G}$.

Let $I$ be a set, let $F$ be an associative group-like family of semigroups indexed by $I$, and let $f$, $g$ be elements of $\operatorname{sum} F$. One can verify that (the multiplication of $\operatorname{sum} F)(f, g)$ is function-like and relation-like.

We now state the proposition
(12) For every finite set $I$ and for every associative group-like family $F$ of semigroups indexed by $I$ holds $\Pi F=\operatorname{sum} F$.

## 3. The Product of One, Two and Three Groups

The following proposition is true
(13) For every non empty groupoid $G_{1}$ holds $\left\langle G_{1}\right\rangle$ is a family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be a non empty groupoid. Then $\left\langle G_{1}\right\rangle$ is a family of semigroups indexed by $\{1\}$.
One can prove the following proposition
(14) For every group-like non empty groupoid $G_{1}$ holds $\left\langle G_{1}\right\rangle$ is a group-like family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be a group-like non empty groupoid. Then $\left\langle G_{1}\right\rangle$ is a group-like family of semigroups indexed by $\{1\}$.

Next we state the proposition
(15) For every associative non empty groupoid $G_{1}$ holds $\left\langle G_{1}\right\rangle$ is an associative family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be an associative non empty groupoid. Then $\left\langle G_{1}\right\rangle$ is an associative family of semigroups indexed by $\{1\}$.

The following proposition is true
(16) For every commutative non empty groupoid $G_{1}$ holds $\left\langle G_{1}\right\rangle$ is a commutative family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be a commutative non empty groupoid. Then $\left\langle G_{1}\right\rangle$ is a commutative family of semigroups indexed by $\{1\}$.

We now state the proposition
(17) For every group $G_{1}$ holds $\left\langle G_{1}\right\rangle$ is a group-like associative family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be a group. Then $\left\langle G_{1}\right\rangle$ is a group-like associative family of semigroups indexed by $\{1\}$.
The following proposition is true
(18) Let $G_{1}$ be a commutative group. Then $\left\langle G_{1}\right\rangle$ is a commutative group-like associative family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be a commutative group. Then $\left\langle G_{1}\right\rangle$ is a group-like associative commutative family of semigroups indexed by $\{1\}$.

Let $G_{1}$ be a non empty groupoid. One can verify that every element of $\Pi$ (the support of $\left\langle G_{1}\right\rangle$ ) is finite sequence-like.

Let $G_{1}$ be a non empty groupoid. One can verify that every element of $\Pi\left\langle G_{1}\right\rangle$ is finite sequencelike.

Let $G_{1}$ be a non empty groupoid and let $x$ be an element of $G_{1}$. Then $\langle x\rangle$ is an element of $\Pi\left\langle G_{1}\right\rangle$.
One can prove the following proposition
(19) For all non empty groupoids $G_{1}, G_{2}$ holds $\left\langle G_{1}, G_{2}\right\rangle$ is a family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be non empty groupoids. Then $\left\langle G_{1}, G_{2}\right\rangle$ is a family of semigroups indexed by $\{1,2\}$. We now state the proposition
(20) For all group-like non empty groupoids $G_{1}, G_{2}$ holds $\left\langle G_{1}, G_{2}\right\rangle$ is a group-like family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be group-like non empty groupoids. Then $\left\langle G_{1}, G_{2}\right\rangle$ is a group-like family of semigroups indexed by $\{1,2\}$.

We now state the proposition
(21) For all associative non empty groupoids $G_{1}, G_{2}$ holds $\left\langle G_{1}, G_{2}\right\rangle$ is an associative family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be associative non empty groupoids. Then $\left\langle G_{1}, G_{2}\right\rangle$ is an associative family of semigroups indexed by $\{1,2\}$.

One can prove the following proposition
(22) For all commutative non empty groupoids $G_{1}, G_{2}$ holds $\left\langle G_{1}, G_{2}\right\rangle$ is a commutative family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be commutative non empty groupoids. Then $\left\langle G_{1}, G_{2}\right\rangle$ is a commutative family of semigroups indexed by $\{1,2\}$.

Next we state the proposition
(23) For all groups $G_{1}, G_{2}$ holds $\left\langle G_{1}, G_{2}\right\rangle$ is a group-like associative family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be groups. Then $\left\langle G_{1}, G_{2}\right\rangle$ is a group-like associative family of semigroups indexed by $\{1,2\}$.

We now state the proposition
(24) Let $G_{1}, G_{2}$ be commutative groups. Then $\left\langle G_{1}, G_{2}\right\rangle$ is a group-like associative commutative family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be commutative groups. Then $\left\langle G_{1}, G_{2}\right\rangle$ is a group-like associative commutative family of semigroups indexed by $\{1,2\}$.

Let $G_{1}, G_{2}$ be non empty groupoids. One can check that every element of $\Pi$ (the support of $\left\langle G_{1}\right.$, $\left.G_{2}\right\rangle$ ) is finite sequence-like.

Let $G_{1}, G_{2}$ be non empty groupoids. Observe that every element of $\prod\left\langle G_{1}, G_{2}\right\rangle$ is finite sequencelike.

Let $G_{1}, G_{2}$ be non empty groupoids, let $x$ be an element of $G_{1}$, and let $y$ be an element of $G_{2}$. Then $\langle x, y\rangle$ is an element of $\Pi\left\langle G_{1}, G_{2}\right\rangle$.

Next we state the proposition
(25) For all non empty groupoids $G_{1}, G_{2}, G_{3}$ holds $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be non empty groupoids. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a family of semigroups indexed by $\{1,2,3\}$.

We now state the proposition
(26) For all group-like non empty groupoids $G_{1}, G_{2}, G_{3}$ holds $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a group-like family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be group-like non empty groupoids. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a group-like family of semigroups indexed by $\{1,2,3\}$.

One can prove the following proposition
(27) Let $G_{1}, G_{2}, G_{3}$ be associative non empty groupoids. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is an associative family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be associative non empty groupoids. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is an associative family of semigroups indexed by $\{1,2,3\}$.

One can prove the following proposition
(28) Let $G_{1}, G_{2}, G_{3}$ be commutative non empty groupoids. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a commutative family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be commutative non empty groupoids. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a commutative family of semigroups indexed by $\{1,2,3\}$.

The following proposition is true
(29) For all groups $G_{1}, G_{2}, G_{3}$ holds $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a group-like associative family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be groups. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a group-like associative family of semigroups indexed by $\{1,2,3\}$.

Next we state the proposition
(30) Let $G_{1}, G_{2}, G_{3}$ be commutative groups. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a group-like associative commutative family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be commutative groups. Then $\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is a group-like associative commutative family of semigroups indexed by $\{1,2,3\}$.

Let $G_{1}, G_{2}, G_{3}$ be non empty groupoids. Note that every element of $\Pi$ (the support of $\left\langle G_{1}, G_{2}\right.$, $\left.G_{3}\right\rangle$ ) is finite sequence-like.

Let $G_{1}, G_{2}$, $G_{3}$ be non empty groupoids. Note that every element of $\Pi\left\langle G_{1}, G_{2}, G_{3}\right\rangle$ is finite sequence-like.

Let $G_{1}, G_{2}, G_{3}$ be non empty groupoids, let $x$ be an element of $G_{1}$, let $y$ be an element of $G_{2}$, and let $z$ be an element of $G_{3}$. Then $\langle x, y, z\rangle$ is an element of $\Pi\left\langle G_{1}, G_{2}, G_{3}\right\rangle$.

For simplicity, we adopt the following rules: $G_{1}, G_{2}, G_{3}$ denote non empty groupoids, $x_{1}, x_{2}$ denote elements of $G_{1}, y_{1}, y_{2}$ denote elements of $G_{2}$, and $z_{1}, z_{2}$ denote elements of $G_{3}$.

Next we state three propositions:
(31) $\left\langle x_{1}\right\rangle \cdot\left\langle x_{2}\right\rangle=\left\langle x_{1} \cdot x_{2}\right\rangle$.
(32) $\left\langle x_{1}, y_{1}\right\rangle \cdot\left\langle x_{2}, y_{2}\right\rangle=\left\langle x_{1} \cdot x_{2}, y_{1} \cdot y_{2}\right\rangle$.
(33) $\left\langle x_{1}, y_{1}, z_{1}\right\rangle \cdot\left\langle x_{2}, y_{2}, z_{2}\right\rangle=\left\langle x_{1} \cdot x_{2}, y_{1} \cdot y_{2}, z_{1} \cdot z_{2}\right\rangle$.

In the sequel $G_{1}, G_{2}, G_{3}$ are group-like non empty groupoids.
Next we state three propositions:

$$
\begin{align*}
& 1_{\Pi\left\langle G_{1}\right\rangle}=\left\langle 1_{\left(G_{1}\right)}\right\rangle  \tag{34}\\
& 1_{\Pi\left\langle G_{1}, G_{2}\right\rangle}=\left\langle 1_{\left(G_{1}\right)}, 1_{\left(G_{2}\right)}\right\rangle .  \tag{35}\\
& 1_{\Pi\left\langle G_{1}, G_{2}, G_{3}\right\rangle}=\left\langle 1_{\left(G_{1}\right)}, 1_{\left(G_{2}\right)}, 1_{\left(G_{3}\right)}\right\rangle .
\end{align*}
$$

For simplicity, we adopt the following convention: $G_{1}, G_{2}, G_{3}$ denote groups, $x$ denotes an element of $G_{1}, y$ denotes an element of $G_{2}$, and $z$ denotes an element of $G_{3}$.

We now state several propositions:
(37) $\left(\langle x\rangle \text { qua element of } \Pi\left\langle G_{1}\right\rangle\right)^{-1}=\left\langle x^{-1}\right\rangle$.
(38) $\left(\langle x, y\rangle \text { qua element of } \Pi\left\langle G_{1}, G_{2}\right\rangle\right)^{-1}=\left\langle x^{-1}, y^{-1}\right\rangle$.
(39) $\left(\langle x, y, z\rangle \text { qua element of } \Pi\left\langle G_{1}, G_{2}, G_{3}\right\rangle\right)^{-1}=\left\langle x^{-1}, y^{-1}, z^{-1}\right\rangle$.
(40) Let $f$ be a function from the carrier of $G_{1}$ into the carrier of $\Pi\left\langle G_{1}\right\rangle$. Suppose that for every element $x$ of $G_{1}$ holds $f(x)=\langle x\rangle$. Then $f$ is a homomorphism from $G_{1}$ to $\Pi\left\langle G_{1}\right\rangle$.
(41) For every homomorphism $f$ from $G_{1}$ to $\Pi\left\langle G_{1}\right\rangle$ such that for every element $x$ of $G_{1}$ holds $f(x)=\langle x\rangle$ holds $f$ is an isomorphism.
(42) $\quad G_{1}$ and $\prod\left\langle G_{1}\right\rangle$ are isomorphic.
